

# Collaboration

## Portal

---

Allow your documents to be available to a wider audience by removing the documentation from local/shared drives, taking out discussions from emails, and enabling a more dynamic and effective level of collaboration.

### Solution

---

The Bitwise approach uses a custom-developed suite of scripts and tools, which enables greater functionality and a more effective approach to collaboration. Key features in the Bitwise solution include:

#### Discussion Boards

Chat and discussion board where various team members can chat and have discussions, which could be logged as a thread.

---

#### Feature Activator

This activates features on all sites within a site collection, without having to manually activate them per site.

---

#### Mail Alerts

Various alerts and notification depending upon various permutations and combinations were implemented.

---

#### Template Replicator

A script that automatically creates a site based on a template.

---

#### Unique Email/Alert Sender

Emails/alerts are sent with custom email ID associated with the list/document library from which it originated, rather than from a common ID, which is the SharePoint default function.

---

#### Validator

A script that validates all the features have been activated and that all the sites and document libraries have been created.

## Key Features

- Central Knowledge Repository
- Information Availability on any Device
- Reduced Search Time
